

# DataPowerMustGather

Last Updated: 2025-12-11

DataPowerMustGather resources can be automatically generated or created by the user for the purpose of generating a mustgather. This mustgather instance will invoke a series of data collection steps within the DataPower Operator pod which will gather frequently requested diagnostic files, then produce a tarball for users to easily transfer out of the pod.

With the use of the [MustGatherManager](#), you can have a DataPowerMustGather generated automatically when specific events occur.

**Note:** This works with multiple replicas, and will sort the information into separate directories per-pod within the tarball.

To see what information is collected, see the mustgather [guide](#).

The current latest version of the DataPowerMustGather API is [v1beta1](#).
